Permission To Show Work In Future Classes

We hereby grant permission to show this report in future courses as a sample project.

Game Title

The title of the game is *Surf n' Turf*. The name reflects the central theme of defending the land ("Turf") from threats emerging through the water ("Surf"). It encapsulates the game's core identity as a river-based tower defence experience where players build terrestrial defences against aquatic enemies. The playful twist on a familiar phrase also helps communicate the game's light-hearted tone and nature-themed strategy focus.

Razor

An onslaught of invasive fish overruns the ravines into a faraway basin, requiring players to place, modify, and upgrade 'towers' in the form of wildlife and fishermen to catch the fish, protecting the ecosystem.

Slogan

The wildlife has become a bit too wild, as rivers overflow with hazardous fish aplenty. Eradicate the colourful onslaught of sealife and take back the ecosystem!

Top-Level Summary Of Game Idea

Surf n' Turf is a slow-paced tower defence game that puts your strategy skills to the test. The feeble county of *Clearwater* needs your help! It's your job to stop radioactive fish from polluting the country's only water source! Plan your defences and build and upgrade powerful towers to stop those pesky fish. Play *Surf n' Turf* to become the hero of Clearwater!

Player Experience, Goals, And Summary

Items From Lazarro's 4 Keys 2 Fun (2014)	
Hard Fun: Mastery, achievement, "fiero")	not at all -----X-----O---- highly so
Easy Fun: Exploring, Imagination, Curiosity, Absorption	not at all --OX----- highly so
Altered States (Serious Fun): Values & Meaning	not at all ----X-O----- highly so
People Fun: Relationships, social bonding etc.	not at all --OX----- highly so

Items From Yee's Player Motivation Taxonomy (2006)

Achievement Component

Advancement: The desire to gain power, progress rapidly, and accumulate in-game symbols of wealth or status	not at all -----X--O----- highly so
Mechanics: Analyzing the underlying rules and system in order to optimize character performance	not at all -----X--O----- highly so
Competition: The desire to challenge and compete with others	not at all -----X--O----- highly so

Social Component

Socializing: Having an interest in helping and chatting with other players	not at all --OX----- highly so
Relationship: The desire to form long-term, meaningful relationships with others	not at all --OX----- highly so
Teamwork: Deriving satisfaction from being part of a group effort.	not at all --OX----- highly so

Immersion Component

Discovery: Finding and knowing things that most other players don't know about	not at all -----X--O----- highly so
Role-Playing: Creating a persona with a background story and interacting with other players to create an improvised story	not at all --OX----- highly so
Customization: Having an interest in customizing the appearance of their character	not at all --OX----- highly so
Escapism: Using the online environment to avoid thinking about real-life problems	not at all -----O--X----- highly so

8 Items From Hunicke Et Al's Taxonomy Of "Fun"	
Sensation: Game as sense-pleasure	not at all -----OX----- highly so
Fantasy: Game as make-believe	not at all -----X-O----- highly so

Discovery: Game as uncharted territory	not at all ---X-O----- highly so
Expression: Game as self-discovery	not at all --O----- highly so
Submission: Game as pastime/go-to leisure activity	not at all -----X-----O----- highly so

Section Summary

We aim for the tower defence to have a relaxing yet engaging atmosphere, built on its low-dexterity, non-intensive, and satisfying gameplay. At its core, the tower defence is centred around advancement. The player gains currency by defeating each enemy wave, which is then used to advance towers through upgrades or the introduction of new towers. There are also high levels of achievement present throughout, as players overcome the challenges of each individual wave, slowly gaining mastery of tower placement and their upgrades. For discovery, each wave introduces a set of enemies, and the player must react accordingly to defeat new types of enemies as they appear. As the player gains an understanding of the mechanics of each tower and enemy, they can further strategize their gameplay, eventually reaching a mastery playstyle. To further challenge the player, as well as provide a greater sense of achievement, there will be a final boss wave to defeat. The boss would just be a menacing high-health enemy, requiring all of the accumulated defences set up by the player.

The tower defence is a single-player game with no elements of cooperation or socialization, so these categories were rated low on their respective scales. Though there is no

immediate in-game socialization, there can be external socialization where players compare their final score with one another. As for the player's representation in the game, there will be no avatar for the player to control, so character customization and role-playing are not elements we are considering. Instead of an avatar, the player simply controls the view of the camera.

Introduction

Players are presented with a series of rivers, weaving through a naturalistic environment. In their setup phase, players are given control to somewhat scan the environment through an ever-present top-down camera perspective. Upon beginning the game, they are presented with an initially-calm influx of fish that begin to travel the waterways. The primary objective of the game is to successfully complete each wave by strategically eradicating all the invasive radioactive fish by placing counter-measures, being the 'towers'.

The consistent gameplay loop requires players to use the sideboard of towers, each having a price and upgrade options, to place objects in the non-aquatic regions— each with an area of effect that allows them to consume/hunt fish at specific rates (of which are displayed as information in the side-board). Players will actively be earning currency dependent on the completion of each wave, which can be used to place further stronger units. Initially, such currency is relatively sparse, to the point where it cannot be wasted, and must be used relatively quickly to ensure one's infantry output scales with the influx of enemy fish. This strategic loop of watching the enemies and placing towers among the interspersed waterways, is the primary gameplay loop— strung together by a linear advancement of difficulty through levels/waves,

Sequential waves increase the output and types of fish, requiring a larger scale of infantry and smarter placement of 'towers'. This is due to alternate passageways opening up as the difficulty scales, increasing in complexity with intently designed rivers. Certain paths require multi-lane management, with doorways opening in an intentional but not explicitly pre-shown (but predetermined) order, since either dam present on the map could burst first. Hints of the dam bursting are given through the wave messages.

Narrative/Story

While Turf n' Surf is not driven by a deep or character-focused narrative, it is built on a cohesive thematic backdrop that grounds the tower defence gameplay. The premise is straightforward: radioactive fish are migrating downstream into Clearwater's only source of clean water, and the player must prevent ecological collapse by constructing defences along the riverbank.

The fish arrive in growing swarms, behaving like a migrating colony whose numbers swell over time. As the waves intensify, the player responds by placing and upgrading rustic, nature-inspired "towers" such as fishermen, bears, and birds. These defences symbolically escalate alongside the threat (nets grow larger, claws strike harder, and birds patrol wider skies), mirroring the rising tension of an invasive species multiplying out of control.

This light environmental framing supports the core mechanics without overshadowing them. The story exists to provide atmosphere and motivation, while the strategic challenge of tower placement, resource management, and reacting to new fish paths remains the true focus of the experience. All practical instructions and context are delivered through the game's introduction and help screens rather than through explicit storytelling.

Game Mechanics

Surf n' Turf is a single-player tower defence game designed for people who enjoy heavy progression mechanics. Furthermore, it is designed for players who prefer strategy mechanics over chance mechanics, since our game has no random elements.

Core game mechanics refer to the repetitive actions that the player performs during gameplay. The repetitive technical components include mouse clicks for the UI, WASD buttons to move the top-down camera, and scrolling on the mouse wheel to adjust the camera's zoom. Similarly, the repetitive in-game actions include placing down towers, upgrading them, and changing the camera view. The repetitive observation patterns include how towers react to enemies, how fast the enemies are defeated, and checking the available currency, so players know when they can upgrade or buy towers.

Progression Mechanic: Similar to most tower defence games, *Surf n' Turf*'s main game mechanic is item/tower progression for more rapid and effective attacks. The game revolves around placing down additional towers and upgrading them; thus, the player's line of defence continuously becomes stronger. During play, the enemy fish progressively become more numerous and increase in health, and in response, the player must put down more towers and upgrade them.

Resource Management Mechanic: By defeating fish and progressing through waves, the game rewards the player with game currency, which allows the player to buy more towers or upgrade towers they already have. With this system in place, the player must allocate money in a strategic manner to obtain upgrades, scaling complexity.

Exploration Mechanic: Our game has a simple map that can be explored very quickly, only showing the paths enemies can take. The primary exploration element of our game is the discovery of the different enemies and features as the game progresses through waves. Additionally, the player can discover the resulting increase in a tower's offensive capabilities as they are upgraded.

Strategy Mechanic: Our game offers a few different tower options along with their upgrades, which offer helpful and specific uses. With these options, the player needs to make strategic plans to optimize their defences. The player must strategize not only which towers and upgrades to place but also the location to place them. This would be placing fishermen near the end of the river to catch quicker fish that slip through other towers. Our game has added the feature of additional enemy doors (dams), one of them being a new entrance for enemies to

spawn, and others opening up new routes for enemies to take. These dams are initially closed at the start of the game but progressively open in later waves. This forces the player to be more strategic in the location of their towers in the early levels, as they need to be prepared for when enemies might enter the map through the other locations. This could be placing towers where the rivers meet, instead of placing them at the river's source. Below are diagrams showing an example of a dam that connects a secondary enemy spawner to the main enemy route, as well as the two dams on our simplified map.

A diagram demonstrating how our secondary spawner relates to our primary spawner.

A diagram showing the map layout with the two dams colored in orange. The dams are numbered in the order they open.

Tower & Enemy Types

Tower (Upgrade/Stage)	Notes	Cost/ Upgrade Cost	Damage	Range	Rate (seconds)
Bird (1)	One bird is displayed on the model.	500	1	3	2
Bird (2)	Two birds are displayed on the model. Can defeat hidden enemies.	600	2	4	2
Bird (3)	Four birds are displayed on the model. Can defeat hidden enemies and big fish.	700	4	5	1
Bear (1)	Attacks all enemies in range. Can defeat big fish.	400	3	1	3
Bear (2)	The model becomes larger. Can defeat hidden enemies and big fish.	500	5	2	2
Fisherman (1)	Defeats one fish at a time, but at a rapid speed.	250	1	1	1
Fisherman (2)	Can defeat hidden enemies. Can place down nets that hold enemies in place, allowing other towers to attack them. The net holds up to 5 fish and will automatically collect all trapped fish if no new fish are caught for 5 seconds. If a passing swarm contains more fish (health) than the net's remaining capacity, the net will still trap that swarm and then immediately mark itself as full and despawn, preventing situations where a net appears not full but refuses to catch a swarm.	300	1	2	1 Net: 5
Fisherman (3)	Has an upgraded net with a different visual and a capacity of 10 fish, using the	350	1	3	1 Net: 10

	same auto-collect and overflow behaviour as Fisherman (2).				
--	--	--	--	--	--

Enemy	Health (# of fish)	Speed/Rate	Waves (1-20)
Basic Fish	1	1	1-10
Big Fish	1	0.75	3-15
Hidden Fish	1	1	5-16
Fast Fish	1	2.5	7-18
Swarm (Basic)	3, 5, 10, 15, 20, ...	1	9-20
Swarm (Big)	3, 5, 10, 15, 20, ...	1	11-20
Swarm (Hidden)	3, 5, 10, 15, 20, ...	1	13-20
Swarm (Fast)	3, 5, 10, ...	2.5	15-20
Boss (All types)	200	0.5	20

Play Matrix

In the play matrix, our tower defence fits in the categories of skill and mental calculation. Since enemy waves and currency calculation are predetermined, there are no elements of chance present, and so this tower defence is placed under the skill continuum. In this game, skill is closely tied to mental calculation, where players become more skillful by developing strategies against each wave. The players must be skillful/mindful in placing towers in optimal locations, especially since there are different enemy types and each tower has its own specialty. As a result, the tower defence is placed under the mental calculation continuum. Note that there exists some physical dexterity, but limited to mouse clicks and camera movement through WASD.

Rule Sheet

See [RuleSheet.pdf](#) for this section.

Playtesting Script

Before Playtesting

Hello and welcome to our game. We would like to start with a few questions before we start this process.

To start, how would you describe a tower defence game? What is your favourite tower defence game? What makes this game interesting to you?

During play, we would like to watch how you interpret the rules and user interface without our help. Are you okay with us watching you play and then asking questions at the end?

During and After Playtest

Goal 1: To ensure that scales are being distributed at an appropriate pace.

Hypothesis: Players will use all their scales to place and upgrade towers in the bottom river, before the dam breaks, which will make them ill-prepared for when new enemy routes are introduced.

Observations to look for: Was the player prepared for the dam break? After the dam broke, did the player have enough scales to place in the upper river?

Post-game questions:

- Did you find the game harder after the dam broke?
- Do you think you had enough scales to place and upgrade towers after the dam broke?

Revision Ideas:

- Give the player more scales right before the dam breaks so that they can place towers in the second river.
- Reduce the number of scales at the start of the game to balance them getting more later on.
- Warn the player in the wave message that the dam will break, and give a longer buffer time in between the waves for the player to prepare.

Goal 2: To ensure that the range for our towers was balanced.

Hypothesis: Some enemies might pass through a tower's range too fast to have any damage inflicted on them.

Observations to look for: Are the enemies receiving damage?

Post-game questions:

- Do you think enemies were receiving enough damage?
- Do you think enemies were moving too fast?

Revision Ideas:

- Giving the towers more range, so when the towers begin to attack, they will no longer miss.
 - Make the enemies move slower, allowing them to stay within attack range for longer.
-

Goal 3: To ensure that the tower models are large enough.

Hypothesis: The player has the ability to zoom in and out of the map. Some players might enjoy playing zoomed out, in which case it might be difficult to see the tower models.

Observations to look for: Do the players play zoomed out or zoomed in? Do they click on towers and then click off? Do players seem to have a hard time

Post-game questions:

- Was it easy for you to see the towers?
- Were you able to easily differentiate between the towers?
- Do you think you'd save time during the game if the towers were easier to see?

Revision Ideas:

- Players were not able to see the tower models (as they were minuscule, especially the birds), so scaling them up will allow for better vision.
-

Goal 4: To ensure that the game is a good length, time-wise.

Hypothesis: The game as of playtesting consists of 4 waves, and this might cause the game to go by too fast for the player to fully enjoy the game.

Observations to look for: Did the players seem to expect the game to be longer? Did they seem to find the waves to be short?

Post-game questions:

- Did you find the game to be too short?
- Do you think the game would benefit from longer waves?
- Do you think the game would benefit from more waves?
- Between more waves and a longer duration of the waves, which do you think the game would benefit more from?
- Do you think more time should be given between waves?

Revision Ideas:

- Make the waves longer by adding more enemies to each wave.
- Make more waves for the game.
- Give more time between waves.

Playtesting Insights & Results

Through our three playtesters, we were able to gather valuable opinions on how we can improve our game.

Issue Name & Explanation	Issue Category	Playtesting Session #	Priority Rating	Resolving Mechanism
Scales being distributed at an appropriate pace	Structure	1	High	• Give the player more scales right before the dam breaks so that they can place towers in the second river
To ensure that the range for our towers was good	Structure	1	Critical	• Give the towers more range
To ensure that the tower models are large enough	Functionality	1	Low	• Make the tower models larger

To ensure that the game is a good length, time-wise.	Functionality and structure	1	High	• Make the waves longer by adding more enemies to each wave • Make more waves for the game • Give more time between waves
Change the button click sound to be less jarring.		1	Low	• Choose a different button click sound
Add a story page to give more context to the game	completeness	1	Low	• Added a story button to the main screen which shows the story

Game Analysis: Choices & Outcomes

Decision Types

According to Fullerton, “games are a series of interesting choices” and each should have “both a potential upside and a downside” that “directly or indirectly impact the player’s ability to win” (2018, p. 356). In *Surf n’ Turf*, players must decide where and when to place different tower types (bears, birds, and fishermen) along the river to prevent waves of radioactive fish from reaching the clean water. These are informed and weighted decisions: players can view the map, anticipate fish routes, and assess tower strengths and weaknesses before committing limited currency (“fish scales”). For instance, a bear tower offers area damage but slower attack speed, while a bird tower provides long-range precision with lower power.

As the game progresses, players face long-term decisions such as whether to invest in upgrading existing towers or saving for new ones; and of course, these effects compound over time. No choice is hollow or obvious, since tower placement and upgrade order directly affect survival. The decision system follows Fullerton’s guidance to build “peaks and valleys” of tension (2018, p. 356): quiet build phases allow reflection, while incoming waves heighten the impact of each strategic move.

Dilemmas

Fullerton defines dilemmas as “situations where players must weigh the consequences of their choices carefully [...] where there is no optimal answer” and “something will be gained and something will be lost” (2018, p. 357). *Surf n’ Turf* incorporates dilemmas through its resource and timing systems. Players continually decide whether to upgrade an existing tower, gaining short-term strength, or save scales for stronger units needed in later waves. Both paths

carry risk: early upgrades might leave the player underpowered for the final boss, while saving too long could allow swarms to break through.

Additional dilemmas emerge through environmental events: pop-up warnings such as “A dam has broken through!” or “Hidden enemies ahead!” force players to adapt tower strategies quickly, balancing defence of multiple routes against limited funds and space. These dilemmas promote strategic depth and embody the “risk versus reward” tension that makes gameplay engaging (Fullerton, 2018, p. 356). By ensuring no purely optimal solution, the system maintains emotional investment and replayability.

Rewards

Fullerton notes that “the most direct consequences for player choices are rewards and punishments” and that “rewards that are useful in obtaining victory carry greater weight” (2018, p. 363). In *Surf n’ Turf*, players earn fish scales after defeating enemy waves. This in-game currency serves as a useful reward, allowing players to purchase or upgrade towers, and ties progression directly to success. Clearing a wave also triggers a romantic reward in the form of satisfying animations, sound cues, or environmental effects, reinforcing a sense of accomplishment without overwhelming the player with meaningless repetition.

Reward timing is structured around wave completions and milestone achievements (e.g., “Wave 3 Cleared!”), following Fullerton’s guidance that “steady streams of small rewards can become meaningless” (2018, p. 363). Occasional milestone celebrations or boss victories provide stronger, well-timed reinforcement. Since the game is single-player, the emphasis lies on personal mastery and visual feedback rather than peer recognition. Together, these elements sustain motivation through a balanced rhythm of progress and reward.

Surprise

Fullerton identifies surprise as “one of the most electrifying tools at a designer’s disposal,” noting that it can “reinvest players in the game” when used thoughtfully, but warns that “too many surprises will alienate players” (2018, p. 365). In *Surf n’ Turf*, surprise operates as a tool to keep tension and curiosity high without undermining player agency. Midway through the campaign, dams along the river suddenly break, opening new enemy paths and forcing players to adapt their defences in real time. These moments of environmental change function as controlled surprises: events that players can prepare for in general but not predict exactly when or how they will unfold. This design transforms routine waves into dynamic challenges, re-engaging the player’s attention and strategy.

Additional surprises occur through various enemy types, such as fast or hidden radioactive fish that require upgraded towers to detect or counter. These unpredictable encounters encourage experimentation and reward players who invest in diverse defences. Finally, the climactic appearance of the final boss, a massive swarm of mutated fish accompanied by ominous sound cues, serves as a deliberate, high-impact surprise timed at the game’s emotional peak.

As Fullerton explains, when players “feel they should have anticipated the event,” surprise becomes especially powerful (p. 365). By weaving surprise into natural points of progression (new waves, environmental shifts, and the final confrontation), *Surf n' Turf* sustains excitement and tension while maintaining fairness and strategic depth.

Endings

Fullerton advises that a game's conclusion should offer “a satisfying reward for all [the player's] effort” (2018, p. 366) and that designers should “align the end goal with the moment of peak excitement” (2018, p. 373). *Surf n' Turf* achieves this through two clear resolutions. Victory occurs when the player defeats the final boss wave, a massive radioactive fish swarm, culminating in a celebratory score screen summarizing performance (coins remaining, enemies defeated, health preserved) and displaying a message such as “You Saved Clearwater!” Conversely, if 100 fish reach the clean water, the ecosystem collapses and a “You Failed!” screen appears, prompting the player to retry and refine their strategy.

Together, these win and loss states build toward the game's emotional peak, offering closure while still inviting replay. This design approach reflects Fullerton's guidance that the resolution should follow “the moment of peak excitement” to maximize emotional payoff (2018, p. 373).

Overall Reflection

Our decision to have players buy, place, and upgrade towers like fishermen, birds, and bears, each representing higher lifeforms in the food chain, was decided to reinforce the ecological narrative of protecting the river ecosystem from invasive fish. The fish themselves came from a desire to have visually similar enemies that could share animations and approximate scale (with a logical reason for moving forward). Most significantly, invasive fish (considered to be potentially either radioactive or some degree of biomutated) make for a wide variety of colours to easily indicate differences intrinsically through gameplay and potential legends rather than vast explanations, nor necessitating colour-matching as was in our last project.

Implementing environmental detail, such as flowing water, may prove to be a challenge, as is the idea of a culminating boss— but both are thematically necessary to the gamefeel. Events such as dams opening and new waves beginning will intrinsically complicate the scripting of enemy behaviours, so level design is integral. Balancing the spawn timings and health scaling of different fish enemies is also a major factor.

Balancing the strength and behaviour of various fish enemies, whether fast-moving/scaling or simply alternating routes against tower capabilities is crucial. Towers having an Area of Effect, while also giving potential for directional abilities make for a more interesting plane of operation, with the ‘field’ being larger enough to accommodate more varied

weapon/attack types. The visual and audio design will also be difficult to balance, but intrinsically linked to the visual thematic foundation with a focus on sea life and ravines.

Appendix

Idea Generation Document

Idea Generation Document

Environment:
The pathway is a river and the enemies are fish
The season is wintery so there is snow on the ground (not anymore?)
The towers can be bears, fishermen, birds

Camera: birds eye view that can pan using arrow keys

Meeting notes:

- We are continuing with the radioactive idea
 - you are trying to stop the radioactive fish trying to reach the clean water
 - two bodies of water, the radioactive water (where the fish come from), and the clean water (what we are defending)
- We need a help screen before the game
 - When a new game event is happening, we can have a pop-up message explaining it
 - ex. a dam has been broken through! fish can now access an additional path!
 - ex. next wave has hidden enemies! upgrade a tower to defeat them!
 - ex. big fish are coming! Fit for a bear's appetite!
- What were defending (the clean water) has 50 health (-1 health for each fish that reaches it)
- Can place as many towers as they have the money for (no tower limit)
- cannot place towers directly on top one another, each tower has some breathing room
 - may need a visual of a circle when placing
- Camera:
 - Birds eye view
 - Can zoom in and out by using Q and E, or scroll wheel on mouse (but needs a mouse so maybe not)
 - Use WASD to move it around
- Route
 - 2 dams that open up one at a time in later rounds
 - They lead to the main current
 - one can be branching off the main river, another could be from a different starting point than the main river, but still lead to the same endpoint
- For enemies getting harder and enemy types
 - enemy health = number of fish in a swarm
 - A swarm of fish is considered one enemy
 - ex. can be a swarm of 4 fish, so there are 4 fish shown in the enemy. For every fish defeated, that fish is visually removed from the swarm.

- enemy's health can be shown above the enemy as a number and a fish icon
- enemy types (appear radioactive, maybe through a visual effect)
 - basic fish (1 hp)
 - big fish (1 hp) (need lvl 1 bear or other towers upgraded)
 - hidden fish, only fin showing (needs towers to be upgraded)
 - swarm of basic fish (3 to 30?) (needs to be scaled based on playtesting)
 - swarm of big fish (3 to 30?)
 - fast fish (hard to kill, need a net to catch first, then other towers kill it)
- Different speeds for different fish
- Fast fishes can be taken out by any tower
- They become more numerous
- **They group together (like 5 together) = 5 Health**
 - Has a **health bar** number
- Large fishes cant be eaten by birds but an upgraded bird is big enough to eat it/upgrade
- Hidden enemies
 - Need to upgrade towers to defend against
- Upgrading our towers:
 - Increasing their rate of attack and damage
- Different towers:
 - Bird ->
 - 3 upgrades
 - 1 bird, 2 birds, 4 birds
 - More range
 - More birds
 - Or type of bird
 - Cheapest to buy
 - Largest range
 - Attack rate - slow
 - Less cooldown
 - Bear ->
 - 2 upgrades
 - More range
 - More damage
 - Second cheapest to buy
 - Medium range
 - Medium attack rate
 - attacks all enemies in range at once (swipes claws)
 - Cooldown
 - Fisherman (?) or fishing rod
 - 3 upgrades
 - No net
 - Bad net (catch ~3 fish)

- Good net (catch ~ 5 to 8 fish)
- nets are placed in the river at a slow rate
 - catch a set number of fish, and once the net is full, the fish are all collected, and the net goes away
- Dirt Cheappppp
- Only gets one fish at a time (on all upgrades)
- Smallest range
- Highest attack rate
- Very little cooldown
- Can attack if in their line of attack for a certain amount of time
- Net
 - Can slow the fishes downgrade of the fisherman
 - An up
 - Gives other towers the ability to attack fast fish
 - Stays for 10 fish and then is reeled in
 - Has a cool down
- Currency
 - Fish scales
 - The different towers can be bought and upgraded through currency
 - Towers can be refunded (50% return)
 -
- Score:
 - Currency left over
 - Time
 - Fish caught
 - remaining defending health
- Waves
 - 20 primary levels
 - Increasing the number of fish swarms
 - A lot of levels that are short
 - Can always upgrade
 - Boss wave?
 - The boss is a big swarm (a clump of radioactive fish)
 - Make it slow
 - other enemies are also present
- sound
 - scary sound when enemies get close to defense
